reference guide

ashland.com / **efficacy usability allure integrity profitability™**

always solving™

Ashland has wide range of ingredients for agrochemical formulations, we want to find an answer to your question and a solution to your challenge. Discover our entire portfolio in this brochure. From the seed of an idea comes a bountiful harvest of solutions when you work with this portfolio and our passionate team of solvers.

agriculture at Ashland

Ashland offers a range of high performing chemistry that helps formulators improve the performance of crop protection chemicals and seed treatments.

We offer our Agrimer™ family of polymers based on pyrrolidone technology, Agrimax™ cellulose ether polymers, AgsolEx™ solvents.

Our products can be used in most every formulary type, including emulsifiable concentrates, suspended concentrates, soluble liquids and powders, water-dispersible granules and seed coatings. They function as adjuvants, binders, rheology modifiers, film formers, complexing agents, wetting agents, dispersants, emulsifiers, among other applications.

More important, our chemistries for agriculture impart a long list of benefits to formulations, including rainfastness; superior spread, stick, and penetration; glossy, transparent, oxygen-permeable, water-proof films; and excellent adhesive properties for seed coating.

This Agricultural Chemicals Reference Guide is organized into four sections according to product group. The sections are: Agrimer™ synthetic polymers and formulated products, Agrimax™ naturally derived polymers, and AgsolEx™ solvents.

Agrimer™ synthetic polymers

Agrimer™ PVP

chemistry

Agrimer™ PVP products are linear, non-ionic polymers that are soluble in water and many organic solvents. They are pH stable, and have adhesive and cohesive properties. The unique ability to adsorb on a host of active ingredients makes Agrimer™ PVP homopolymers preferred co-dispersants in many formulations.

benefits

- compatible with a variety of active ingredients, resins and electrolytes
- enhances surface active properties of select surfactants
- forms hard glossy, transparent, oxygen permeable films
- forms films with water activity
- adhesive and cohesive properties
- crosslinkable

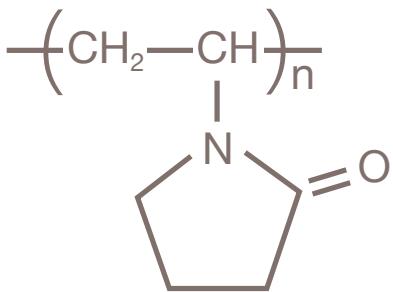

suggested applications

- complexing agent
- stabilizers / co-dispersants
- binders in dry / wet granulation and extrusion (dry compaction / fluidized-bed spray drying process)
- film-forming agents / binders in seed coatings, dips and pour-ons
- biological stabilization
- water binding / anti-transpiration properties
- solubility enhancers via co-precipitation or thermal extrusion
- dye-binding agent

Agrimer™ AT and ATF

chemistry

Agrimer™ AT polymer is a cross-linked Agrimer™ PVP product that absorbs and swells with water / solvent, but is insoluble in aqueous and organic media. Agrimer™ AT polymer has high capillary hydration capacity that provides for high efficiency disintegration in tablets and granules. Agrimer™ ATF polymer is a finer particle size version of Agrimer™ AT polymer.

- insoluble in aqueous and organic media
- stable under acidic and alkaline conditions
- premium disintegrant
- excellent dry binder

benefits

- produce hard granules with low friability at low compression forces, reducing dusting and breakage during transport and storage
- effective as sequestrant for some toxicants
- complex with phenolic acids moieties
- maintain seed moisture and enhance germination in seed coatings

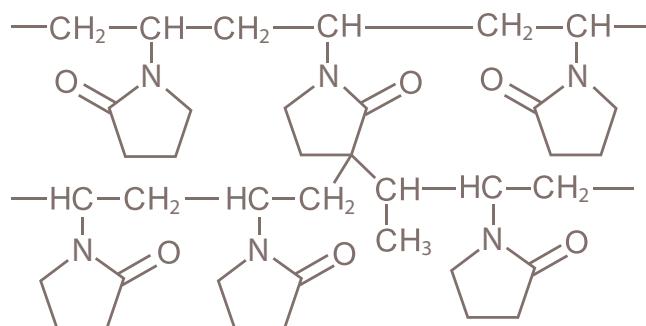

properties

■ commercial application □ potential application – n/a

- quick disintegration upon addition to the spray tank or when contacted with water
- inherent binder properties and compatible with most co-formulants
- not tacky under humid conditions
- does not form gels

suggested applications

- disintegrants for wdg (water-dispersible granules) and tablets
- for wet granulation, dry compaction, fluid bed, spray drying and extrusion processes
- seed tapes
- dye binder in seed coatings

Agrimer™ AL

chemistry

The Agrimer™ AL family of alkylated vinyl pyrrolidone products are surface active non-ionic polymers. The backbone includes hydrophobic and hydrophilic moieties, which drive the polymer to either the water-air or water-oil interface, providing emulsion stabilization and rainfastness benefits.

benefits

- dispersion aid in oil dispersion formulations
- adhesive properties
- spreader-sticker and anti-flocculant in one polymer
- effective in reducing oil-water interfacial tension
- not sensitive to pH or salts
- reduce viscosity of flowables, permitting high active ingredient loading
- add viscosity and prevent active ingredient precipitation in suspension concentrates
- foliar adhesion
- wash-off resistant interfacial films for enhanced efficacy

- optimize biological efficacy
- antitranspirant properties

suggested applications

- oil dispersions
- emulsifier and anti-flocculant
- crystal inhibition
- multiple emulsions / stabilization of water-in-oil and oil-in-water emulsions
- anti-flocculants for flowables and concentrated suspensions for high active ingredient loading
- rainfastness: form waterproof films that minimize wash-off of crop protection chemicals from foliage

Agrimer™ VA

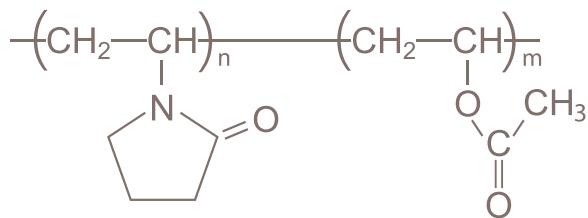

chemistry

Agrimer™ VA series include linear random copolymers that form hard, glossy, thermoplastic films. The films are oxygen permeable with good water holding properties, appropriate for seed coatings and leaf adhesion. Agrimer™ VA copolymers have good adhesive, cohesive, and binding properties for several substrates and a host of active ingredients. Can be used as a co-dispersant in enhancing solubility/dispersibility of complex active ingredients for improved bio-availability.

benefits

- forms films with a wide range of water resistance properties
- dusting reduction in coatings
- uniform films that enhance survival rate of rhizobia
- adhesive and cohesive properties

properties

- can enhance hydrophobic active ingredient solubility / dispersibility
- effective at reducing surface tension of water
- effective at reducing oil/water interfacial tension

suggested applications

- seed coatings
- binders for water dispersible granules
- film forming agent
- co-stabilizers in water-based flowable formulations
- controlled release via co-precipitation with polybasic acids
- binders in thermal extrusion

Agrimer™ VEMA

chemistry

Agrimer™ VEMA polymers are based on linear alternating polymers (methyl vinyl ether/maleic anhydride), which can be further modified to adjust the polymer properties.

benefits

- surface active polymers (nonionic and anionic)
- forms derivatives that can impart controlled release properties with certain actives
- polyelectrolytic properties
- adhesive and cohesive properties
- forms transparent films

suggested applications

- polymeric co-dispersants
- enhance active ingredient solubility/dispersibility via co-precipitation
- binders in dry, wet granulation, hot melt extrusion

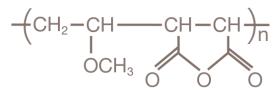

properties

Agrimer™ ST Agrimer™ DA

chemistry

Agrimer™ ST Vinylpyrrolidone/styrene copolymer emulsion. Fluid, milky-white emulsion, with solids content of approximately 40%.

Agrimer™ DA VP/dimethylaminoethyl methacrylate copolymers. A series of copolymers covering a wide range of VP / DMAEMA molar ratios. Available as water and alcohol solutions.

benefits

Agrimer™ ST

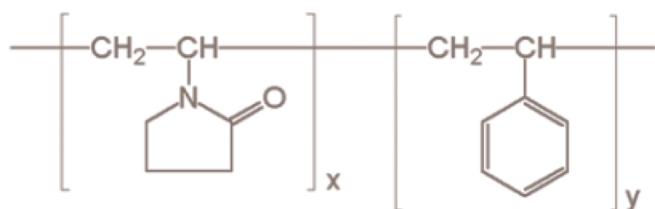

- forms strong, light stable films with high water resistance
- sub-micron particle size (>5 micron)
- pH: 2-5
- stable, moderately viscous dispersion
- high acid and salt tolerance

Agrimer™ DA

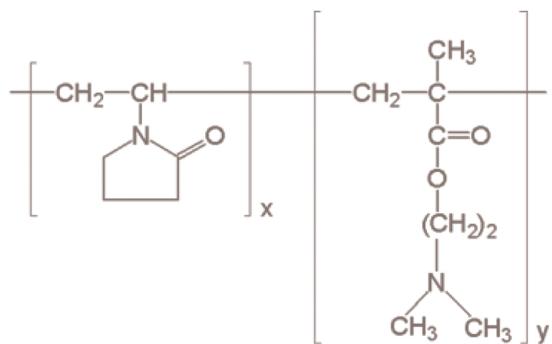

- compatible with most anionic, nonionic and cationic surfactants
- pseudo-cationic, substantiative to negatively charged surfaces

Easy-Sperse™ P-20 Microflex-1™ EasyWet™ 20 Agrimax™ 3H ULN

chemistry

Easy-Sperse™ P-20 is a proprietary polymer blend that produces excellent suspendability at high dilution in SC and WDG formulations. More forgiving to AI impurities.

Microflex-1™ is an effective delivery system for use with a variety of agricultural insecticides, fungicides and animal health applications.

Premium EasyWet™ 20 wetting agent allows wetting both high and low energy surfaces at very low concentrations.

Agrimax™ 3H ULN is an oil-based microemulsion forming matrix that enhances rainfastness and provides for excellent wetting of leaf surfaces.

benefits

Easy-Sperse™ P-20

- improved suspension of diluted formulations
- superior stability of hydrophobic actives
- added benefit of rainfast properties

Microflex-1™

- excellent solvency and emulsification
- high actives loading
- long-term stability

Agrimax™ C

chemistry

The starting material for the manufacture of cellulose ethers is highly purified cellulose.

Cellulose is a polysaccharide composed of anhydroglucose units, which are linked through beta-glycosidic bonds. The number "n" of anhydroglucose units in the polymer chain is defined as the degree of polymerisation (DP).

Each anhydroglucose ring carries three free OH-groups at positions 2, 3 and 6. Ethers of cellulose are formed by substituting one or more of the three hydroxyl groups. The distribution of the substituents introduced onto the polymer chain is largely determined by the relative reactivity of these three OH-groups.

The number of substituted hydroxyl groups per anhydroglucose unit is expressed as DS or average degree of substitution. The DS can vary between 0 and 3.

In the case of alkylation the molar ratio of alkoxy groups in the side chains to cellulose is specified and expressed as the average molecular substitution (MS).

Instead of DS and MS, the weight percent of the substituents in the cellulose ether is often quoted. The use of one etherification agent in the substitution process results in a simple cellulose ether, whereas using different kinds of agents leads to mixed ethers. Industrial cellulose ethers are alkyl, alkylhydroxyalkyl, hydroxyalkyl, and carboxyalkyl ethers.

benefits and applications

Cellulose ethers have a great number of valuable properties, which find application in numerous crop protection and seed coating application areas. The following is a list of these properties.

thickening action

The viscosity of various aqueous, aqueous-organic, and organic solutions, slurries, and dispersions can be adjusted to the desired level by addition of small amounts of cellulose ethers.

rheology

The rheology and consistency of solutions are controlled either thru the molecular weight of cellulose ethers or its concentration.

film formation

Films with high transparency and tensile strength can be prepared from cellulose ethers solutions. These films are soluble in water and resistant to most organic solvents, fats and oils.

suspending action

Depending on the type of substituent, the degree of substitution and the solution viscosity cellulose ethers is a suitable suspending agent.

water retention

High viscosity types of cellulose ethers exhibit excellent water retention. This property is beneficially used for preventing syneresis. The water retention capacity is proportional to the concentration and solution viscosity of the cellulose ether grade chosen.

binding ability

Due to their polymeric structure Agrimax™ C Series cellulose ethers have good binding ability.

Agrimax™ cellulose ethers for regulated applications		
chemical term	abbreviation	Agrimax™ trademark
methylcellulose	MC	Agrimax™ C300
methylhydroxypropylcellulose	MHPC	Agrimax™ C400
hydroxyethylcellulose	HEC	Agrimax™ C100
hydroxypropylcellulose	HPC	Agrimax™ C200
sodium carboxymethylcellulose	CMC	Agrimax™ C600

Agrimax™ C

controlled release properties

Like other Agrimax™ C cellulose ethers when brought in contact with aqueous systems, cellulose ethers form gels that dissolve slowly. With this attribute, cellulose ethers are used as a sustained release agent in matrix tablets where the gel layer forms a diffusion barrier for active ingredients to permeate.

surface activity

Depending on the type of substituent and degree of substitution, cellulose ethers are suitable as suspension and emulsifying agents and as protective colloids due to their surface activity.

stabilizing action

By adding small amounts of cellulose ethers, the stability of emulsion systems is improved.

Agrimax™ GR

Guar offers solutions for the management of droplet size to minimize the effect of pesticide drift

chemistry

Agrimax™ GR 100 is a water-soluble guar offered as a powder. It is compatible with a wide range of polymers of different charges. It is used as stabilization and thickening of a product. Typical use level is between 0.1-2.0% on product basis

Agrimax™ GR 200 is a cold-water soluble polysaccharide derivative that is easily dispersed and provides high viscosity at low concentrations.

AgsolEx™

chemistry

AgsolEx™ 1 water-soluble aprotic solvent with outstanding solvency for a broad range of actives. Used as synthetic media and in liquid formulations. Best used in combination with water insoluble solvents.

AgsolEx™ 8 water-insoluble surface active solvent ideal for liquid formulations; improves wetting, penetration of AI through the cuticle and inhibits crystal formation.

AgsolEx™ 8 and AgsolEx™ 12 have a unique combination of solvency and surface activity. AgsolEx™ 12 is more hydrophobic and surface active than AgsolEx™ 8.

AgsolEx™ BLO water-soluble solvent for liquid formulations, synthesis medium and intermediate. Reacts with free hydroxy or amino moieties. Avoid long-term storage with water. Best used in combination with water insoluble solvents.

Grandlure Complete

chemistry

Grandlure Complete is a synthetic pheromone for Cotton boll Weevils which feeds on cotton buds and flowers.

Ashland has a long tradition of manufacturing pheromones at our Columbus facility Ohio USA, in addition to Grandlure complete we can consider for manufacturing, Trimedlure, Tricosene, Cuelure, Gossyplure, Disparlure and Lycolure.

identification

Common/Trade Names: Boll Weevil Aggregation Pheromone, Grandlure, Luretape.

Other Code Numbers: CAS 11104-05-5.

chemistry

Composition: (cis)-1-methyl-2-(1-methylethenyl)cyclobutaneethanol (I), mixture with (Z)-2-(3,3-dimethylcyclohexylidene)-ethanol (II) and Z+E(3,3-dimethylcyclohexylidene)-acetaldehyde(III& IV) (CAS.)

Class: Attractant.

Properties: Clear to very pale yellow, slightly viscous liquid with a mild, pleasant odor. Melting point < - 40°C. Boiling point 240°(at 760 mm Hg). Vapor pressure N/ A. Specific gravity 0.922 g/ml at 20°C.

action/use

Action: Insect Pheromone.

Use: The boll weevil is the target insect. Once male boll weevils locate their host plant, cotton, feeding ensues, and the weevils release their aggregation pheromones to attract additional boll weevils to the aggregation site. Grandlure is used to lure boll weevils into traps.

Formulations: Traps are baited with one-inch square laminated polyvinyl chloride dispensers impregnated with Grandlure.

registration notes

Luretape*.

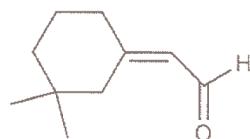

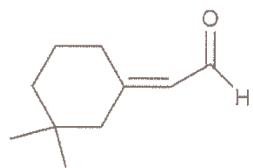

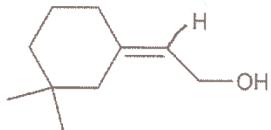

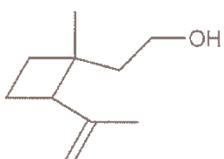

environmental guidelines

Hazards: To the best of our knowledge, the toxicological effects of this compound have not been fully explored.

Solubility (In Water): <1% at 25°C.

safety guidelines

Toxicity: To the best of our knowledge, the ecological effects of this compound have not been fully explored.

specifications

Test	Acceptance Criteria
Description	Clear, colorless to light yellow liquid Mild, pleasant odor
Identity (IR)	Conforms to standard
Purity (GC, DB-1 Capillary)	Not less than 95%
Isomer Content (DB-1 Capillary)	I 30 -35% II 35- 40% III 13 -15% IV 13 -15%
